

ACS Export

C•CURE 9000

C•CURE 9000 (Software House / Johnson Controls — on-prem, SQL Server)

1. **Scope the data:** journal events (the main event log), clearances, doors.
2. **Confirm access path:** C•CURE 9000 Administration Station (Reports), direct SQL on the SWHSystem database, or the C•CURE REST API / victor Web Service (available in recent versions; requires licensing).
3. **Pick an export method:**
 - a. *Built-in Reports.* Reports pane → Journal / Audit / Personnel / Hardware reports → set 30-day window → Export to CSV/Excel from the viewer.
4. **Run the export:** consistent time zone, include object GUIDs/IDs for joins, pull event-type lookup tables so message codes are decodable.
5. **Normalize:** per-resource CSVs or one .xlsx with tabs.
6. **Sanity-check:** journal row counts against the Administration Station's Journal view for the same window.
