

ACS Export

Verkada

1. **Scope the data:** access events (door unlock, denied, propped, forced), door/site inventory, alarm events, and camera/sensor telemetry if you're including video/environmental devices.
2. **Confirm your access path:** Command admin portal (in-product CSV exports) or Verkada REST API at api.verkada.com (requires an API key generated in Command → Settings → API).
3. **Pick an export method:**
 - a. *Command portal (easiest).* Events → filter to last 30 days → Export to CSV. Repeat for Users, Access Levels, Audit Log. Limited row caps per export — you may need to chunk by week.
4. **Run the export:** use UTC timestamps (API returns epoch), paginate fully, and pull lookups (door IDs → door names, user IDs → emails) so events are decodable.
5. **Normalize:** one CSV per resource type (events, doors, users, audit, devices), or combine into a single .xlsx with tabs.
6. **Sanity-check:** event count for the window should roughly match the Command "Events" view total.
